NMEA File Transfer is a software that allows the transfer of NMEA formatted files from a computer to a destination connected to the serial port or TCP/IP. NMEA data is a specific format used by receivers and GPS modules to store information. It is a text file with a file header, then a series of data lines with NMEA keywords, separated by a CR. When a file is sent it is converted to NMEA data format. The file header is deleted and the CR added at the end of the file. The keywords are then added to the end of the file. The keywords are then transmitted to the destination. This software does not have a user manual, but has a series of options available for users to access and choose from. The options available are: serial port, TCP/IP and file or file list. This software also has a basic terminal screen to monitor the status of the transfer. To Use: NMEA File Transfer is very easy to use, you will need to set up the destination, by setting the

parameters of the destination, and connecting to it. The serial port or TCP/IP address must be specified, but the user can choose to download a list of files, or import a list from the computer the software is being used from. The Program: NMEA File Transfer does what it says, it transfers data via serial port or TCP/IP. If you send data via a serial port, the data is sent line by line, separated by a CR. If you send data over TCP/IP the data is sent as one long string of data. If data is sent via TCP/IP the user will have to specify the ports for the connection to be made. Once the application is loaded the user can specify the ports for the connection, by entering the IP address and port number. There is also a connection tab, which specifies the time for the connection to be made, and also shows the current connection to the destination. There is also a view tab, which shows the status of the process, and also allows the user to monitor the process. If the user wishes to monitor the process, they can enter a specific page number and receive a page that monitors the data being

sent. When a file is sent, the user will see in the view tab a list of the files being sent. The user can then choose what type of file they want
