Photoshop and other art software are constantly being upgraded. Tutorials, books, and magazines are available to help you learn how to use Photoshop. Photoshop CS5 offers options for enhancing image quality at all stages of the workflow. "Photoshop is the industry standard tool in the graphic arts and design business and I know my technology and I know what the right tool for the job is. Of course, I don't think that Photoshop is the only right tool in the design business, but I do think that it's the best. Sometimes I tell customers to stay away from Photoshop for small jobs because it's too complicated and the professionals have the time to do things properly. But I can't talk to them about it if they insist on using it, so I let them. Of course, I can't let them use it for large jobs because I don't have the time. So there's a lot of confusion in the design business and I can't let anyone tell me that Photoshop is the only right tool." —Wendy LaTourette

The present invention relates to the field of laser ablation of solid surfaces. It has particular relevance in the context of the laser ablation of semiconductor wafer surfaces. Laser micro-ablation of semiconductor wafers is a technique used for forming trenches in the wafer. These trenches can then be etched to form dielectric isolation regions. Other applications include removing unwanted material from dielectric layers which have been deposited over the wafer. Laser ablation of a solid surface typically involves irradiating a surface of the solid surface with a laser beam, and removing material from the surface by ablation. An upper surface of the solid may be covered with a process window which is defined to surround a region of the upper surface which is to be ablated. Typically, the laser beam is focused to a target diameter within the process window. Prior to the application of the laser beam, a suitable initiator is required to be present in the process window. One such initiator is an absorbing dye which is dissolved in the dielectric material. When the laser beam irradiates the initiator, the initiator decomposes and reacts with surrounding atmosphere to provide a reactive gas. The reactive gas is subsequently absorbed by the underlying solid material, so that the solid material is ablated from the upper surface. It is known to incorporate an initiator into a scribing pattern, so that, when the laser beam passes over the scribing pattern, the surface material is scribed and ablated. For example, U.S. Pat. No. 5,843,607 discloses a method for scribing patterns on a surface of a substrate by forming a scribing pattern of a substance, such as a dye, on a substrate, placing the substrate, with the scribing pattern on the upper surface, in a chamber, evacuating the chamber, and applying laser energy to the substrate and scribing pattern to form a scribed region. After the scribed region is formed, a dielectric material is applied to the scribed region. However, the necessity of incorporating initiators into the scribing pattern can be undesirable. For example, the scribing pattern of the initiator (typically a dye) may be visible as a dark line in the resulting scribed region. In addition, the initiator will slowly dissolve or diffuse into the underlying surface layer, thereby reducing the effect of the scribing pattern. U.S. Pat. No. 5,772,784 discloses the use

Welcome! Please, make yourself comfortable. I am Dr. Elizabeth M. Stotler, an award-winning researcher and author, and here I will share my insights and impressions as I have pursued them. Sunday, April 16, 2012 Forbidden Book Club: May 3, 2012 First, I am pleased to announce that the next book club will take place on May 3. The subject is: Forbidden by Michael Buckley This novel is set in the near future and concerns a surgical mutilation which allows women to bear children without sons. Jealousy about this new ability has caused women to become increasingly aggressive and violent, and their sons have become increasingly violent in turn. Eventually, civil war breaks out. Please join me for the May 3 meeting. I always enjoy this type of topic, and I appreciate your feedback on it. Dr. Elizabeth M. Stotler About Me I am an award-winning researcher and author of six nonfiction books and the author of one novel, Forbidden. My upcoming books include an introduction to evolutionary theory and an edited collection on happiness. Site-specific mutations in the receptor-binding domain of envelope glycoprotein (gp) E1 of the feline infectious peritonitis virus (FIPV) affect stability and infectivity of viral particles. The sequence of the recently identified envelope protein, gpE1 of the feline infectious peritonitis virus (FIPV) was determined. The protein differs in the amino acid sequence from the analogous proteins of epizootic cat virus (ECTV) and of the prototype mink enteritis virus (Mne) by the absence of two glycosylation sites, which are present in the ECTV and Mne protein sequences. A detailed analysis of the receptor-binding domain (RBD) of this protein showed only one amino acid sequence difference in a stretch of nine residues. To analyse the influence of this difference in the RBD on the protein function the same sequence was exchanged in a vector for a fusion protein between the E1 sequences of the two viruses.
